

## Grapple for Forklift

Forklift Grapple - On excavators, grapples could be utilized in conjunction with the crowing operation of the bucket cylinder. They are able to mount directly to the jib and can be used when processing and handling domestic and aggregate waste materials, timber and construction materials. The grapple's boxed design has added support bridging. This manufactured design provides the grapple with maximum strength and support by means of stopping the body from breaking and turning during its function.

The grapple along with all of its moving parts are constructed of hardened steel. The revolving points are designed in order to guarantee supreme closing force and holding ability. The operator has the capacity to deal with different sizes and varieties of materials using the jaws built-in at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for maximum handling capacity.
